

Practical - 7

Practical Title: PHP Form Processing with Server-Side Validation and CSV/JSON File Storage
Problem Definition: Display event lists, student profiles, notices, or FAQs from external JSON files using Fetch API. Implement dynamic rendering, search, filter, sorting, and pagination.

Theory :

1. Is the form submitted using POST?

Ans: Yes, the form uses the POST method to submit data securely.

2. Are inputs validated and sanitized server side?

Ans: Yes, inputs are validated and sanitized on the server side.

3. Is file writing handled safely?

Ans: Yes, file writing is performed safely with proper handling.

4. Are success and error responses displayed clearly?

Ans: Yes, clear success and error messages are displayed to the user.

Data:

Process.php:

```

<?php

if ($_SERVER["REQUEST_METHOD"] == "POST") {

    $name = trim($_POST["name"] ?? "");
    $email = trim($_POST["email"] ?? "");
    $mobile = trim($_POST["mobile"] ?? "");
    $password = $_POST["password"] ?? "";
    $confirm = $_POST["confirm"] ?? "";
    $dob = $_POST["dob"] ?? "";
    $gender = $_POST["gender"] ?? "";
    $course = $_POST["course"] ?? "";
    $address = trim($_POST["address"] ?? "");

    $skills = $_POST["skills"] ?? [];

    $skillsText = implode(", ", $skills);

    $errors = [];

    // Validation

    if (empty($name)) {
        $errors[] = "Name is required.";
    }

    if (!filter_var($email, FILTER_VALIDATE_EMAIL)) {
        $errors[] = "Invalid email.";
    }

    if (!preg_match("/^[0-9]{10}$/", $mobile)) {
        $errors[] = "Mobile number must contain 10 digits.";
    }

    if (strlen($password) < 6) {
        $errors[] = "Password must be at least 6 characters.";
    }

    if ($password !== $confirm) {

```

View.php:

```

} else {

    $handle = fopen($file, "r");

    if ($handle !== false) {

        echo "<table>";

        // Read first row as table header
        $headers = fgetcsv($handle);

        if ($headers !== false) {

            echo "<tr>";

            foreach ($headers as $header) {

                echo "<th>" . htmlspecialchars($header) . "</th>";

            }

            echo "</tr>";

        }

        // Read remaining rows
        while (($row = fgetcsv($handle)) !== false) {

            echo "<tr>";

            foreach ($row as $data) {

                echo "<td>" . htmlspecialchars($data) . "</td>";

            }

        }

    }

}

```

Implementation/ Output/Result

```

Learning Outcomes:

- >Students will understand how to process form data using PHP POST requests.
- >Students will implement server-side validation and input sanitization.
- >Students will learn safe file handling and storage using CSV/JSON formats.
- >Students will display clear success and error messages based on processing results.
- >Students will develop a secure and reliable backend form-processing system.

Faculty Remarks: (Keep this blank for faculty)
