Practical - 11

Practical Title: Student Management CRUD with Search and Filter

Problem Definition: Create a student management module to add, view, edit, delete, search and filter student records. All database operations must use MySQLi statements and clear success/failure messages.

Theory :

1. Are SELECT, INSERT, UPDATE, and DELETE operations working?

Yes. INSERT adds a new student record, SELECT displays all student records in a table, UPDATE edits the selected student record using an edit form, and DELETE removes a student record. All operations use MySQLi prepared statements, and a success or failure message is shown after each operation.

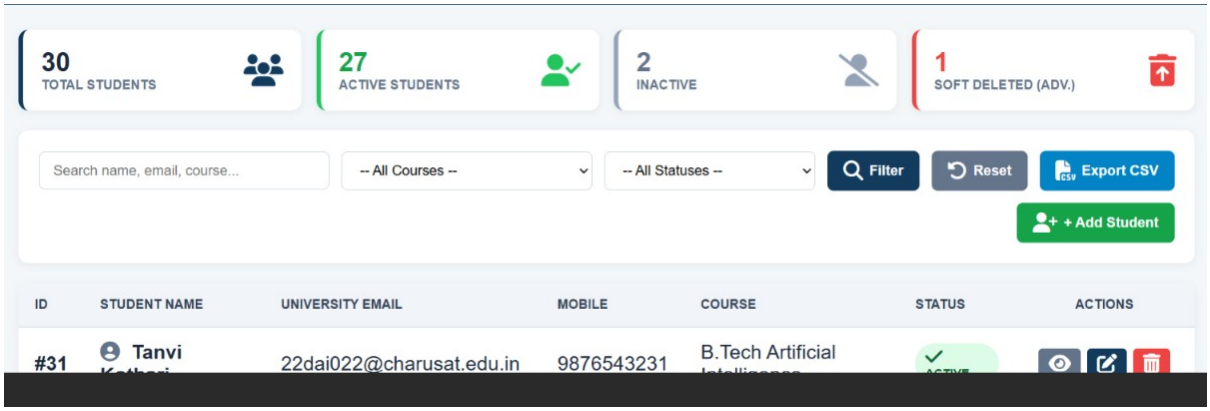

2. Is search by name/email/course implemented?

Yes. A search box sends the keyword using the GET method, and the SELECT query uses LIKE to match the name, email or course. A course dropdown is also provided for filtering using a WHERE condition, and search and filter can work together.

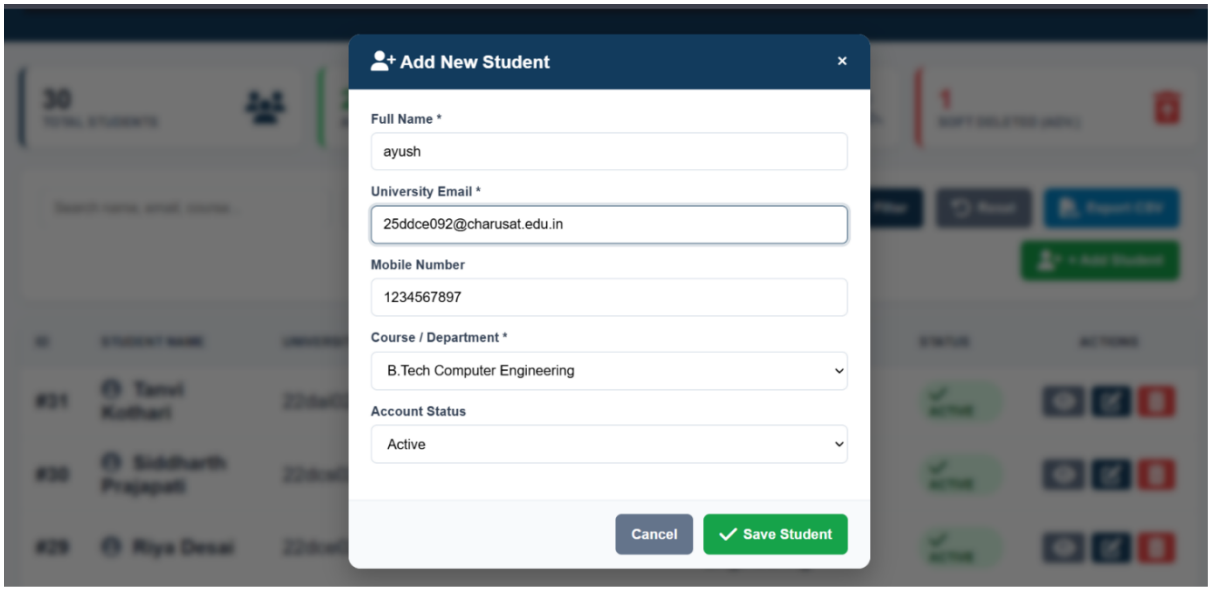

3. Are delete operations confirmed before execution?

Yes. When the user clicks the Delete button, a JavaScript confirm() dialog asks "Are you sure you want to delete this student?". The record is deleted only when the user clicks OK. Otherwise nothing happens.

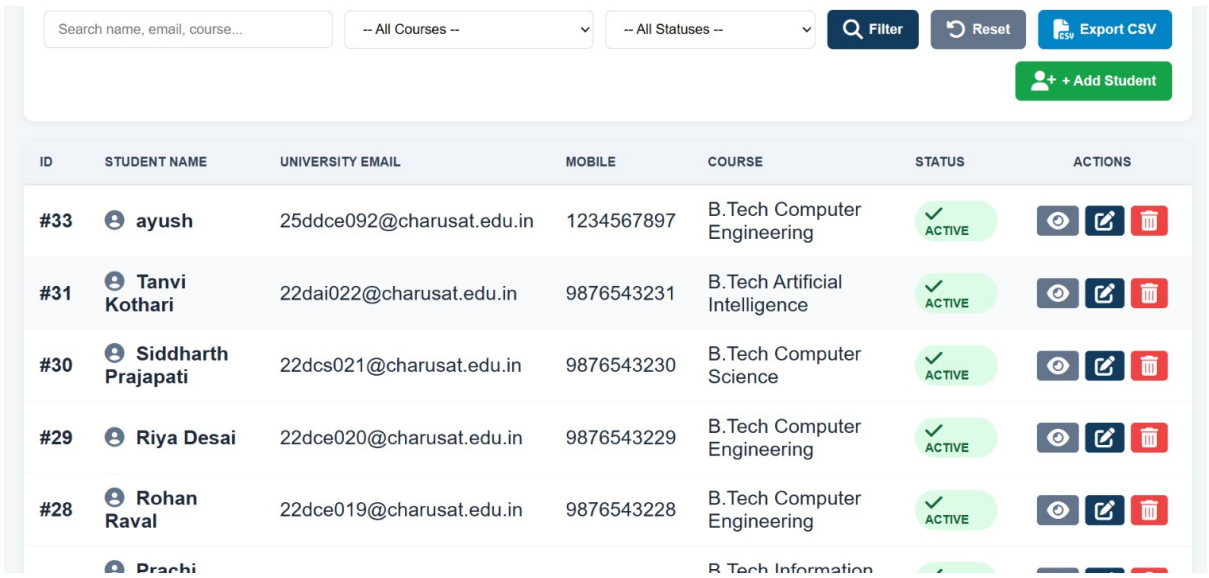

Implementation/ Output/Result

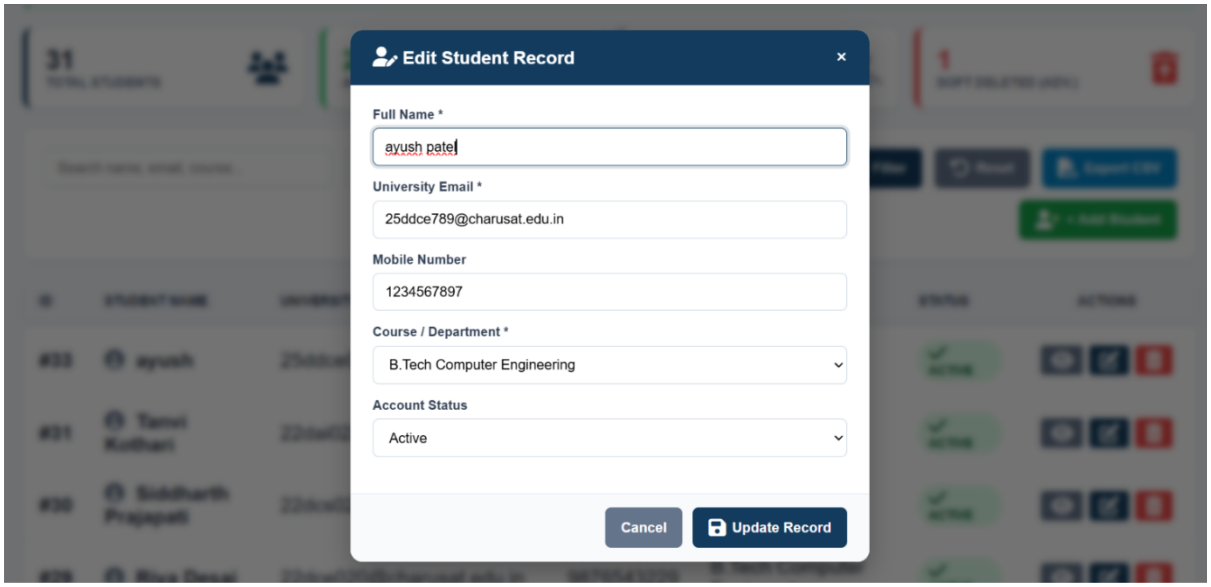

(Main)

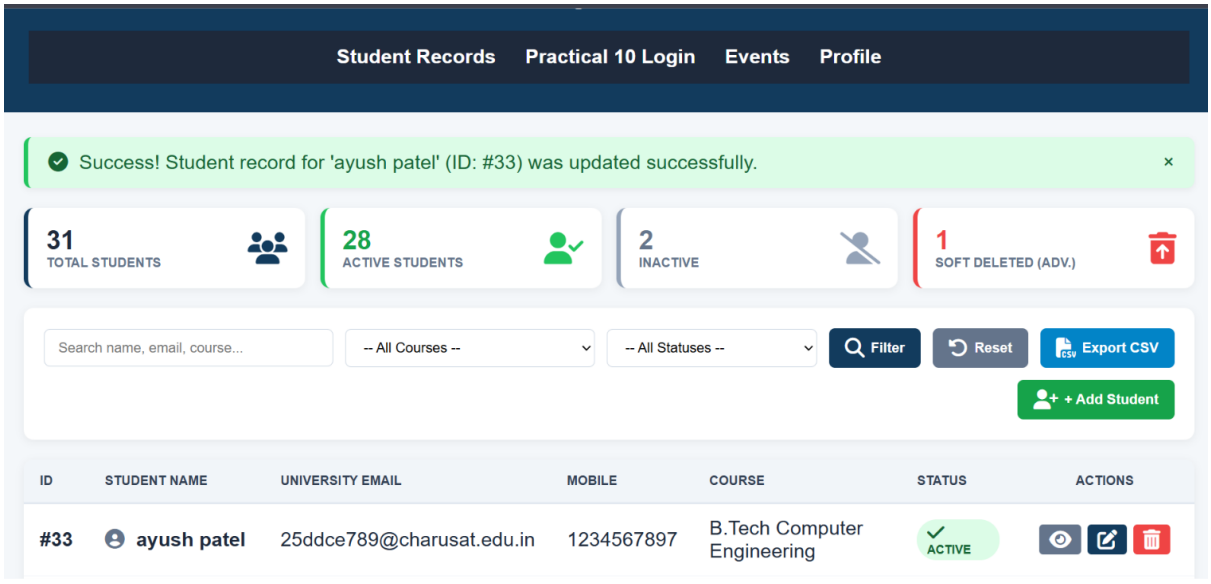

(Add new)

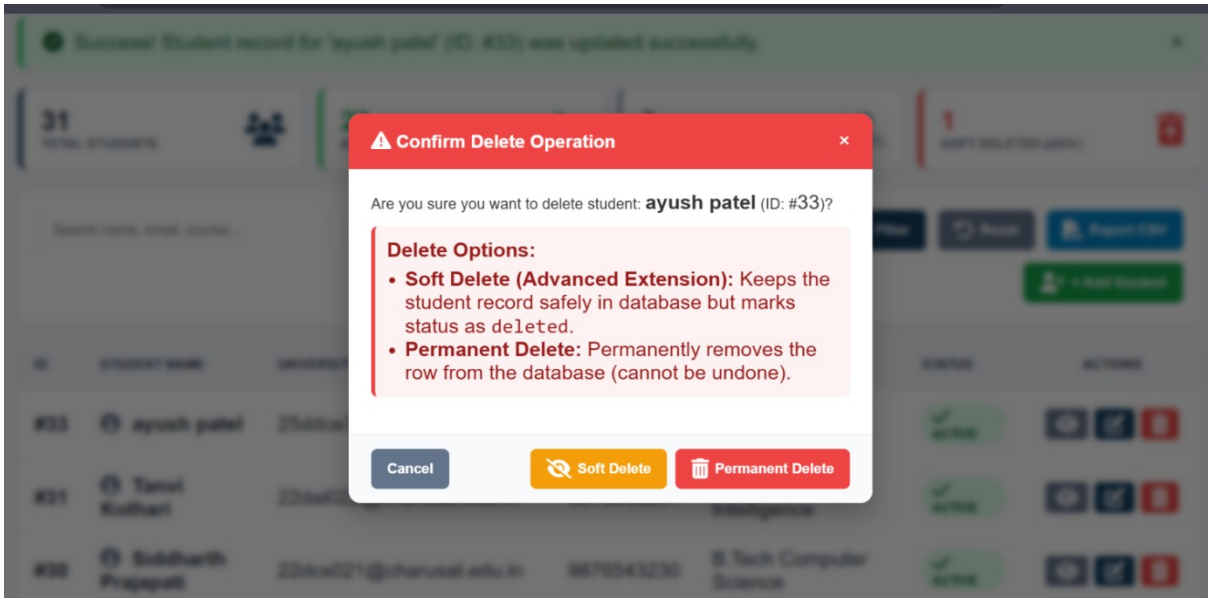

(Updated)

(Update Record)

(Delete)

GitHub Repository Link:

https://github.com/ayushposhiya00-lab/Student-Hub/tree/main/Practical-11

Learning Outcomes:

- Understand how to perform CRUD operations using PHP and MySQLi.
- Implement search and filter for database records.
- Show clear success and failure messages to the user.
- Develop a complete and secure data-management page.

Faculty Remarks: (Keep this blank for faculty)
